Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Maximum DB seq length: 2000000000

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                             The present sequence represents a cytochrome P450 monooxygenase. The specification describes a modified cytochrome P450 monooxygenase which can oxidize at least one of the following types of substrates: optionally substituted mono- or poly-cyclic aromatic heterocyclics containing nitrogen, sulphur or oxygen; optionally substituted mono- or poly-cyclic aromatics; linear or branched alkanes or alkenes; or optionally substituted cycloalkanes or cycloalkenes. The modified cytochrome P450 monooxygenase are specifically used to oxidize indole to indigo and indorubicin. However, they may be used to oxidize many

This invention describes a novel electron donor system (M1) that
transfers electrons to an enzyme with redox properties comprising an
inorganic, not electrode-bound, electron sink and a mediator which enable
the electron transfer. The invention also describes (1) transferring (M2)
oxygen to a hydrocarbon containing hydrogen donor molecule, where the
hydrogen donor molecule is in a reaction medium comprising the oxygen
transferring enzyme and (M1) in the presence of oxygen and incubating
under suitable reaction conditions; (2) the enzymatic production (M3) of
terminally or subterminally hydroxylated (position omega-1 to omega-4)
centry acids comprising; (i) mixing a hydroxylatable fatty acid or fatty
acid derivative in the presence of (M1) and cytochrome P450
monooxygenase; and (ii) isolating the hydroxylated product; (3) a
conformation (2); and (4) detecting (M4) fatty acid-monooxygenases
comprising: (i) contacting the analyte with a omega-hydroxylatable fatty

        label in (M1); and (ii) qualitatively or quantitatively detecting the signal. The invention is useful for the production of omega-hydroxylated fatty acids and the detection of fatty acid monoxygenases. The invention provides an alternative electron donor system of enzymes with redox properties that is cheaper and more efficient, where the enzyme

The invention also describes (1) nucleic acid (II) end other complement; (2) expression cassette (EC) containing (II) and ontrol elements; (3) a vector containing at least one EC; (4) recombinant microorganisms transformed with at least one vector of (3); and (5) enzymatic production of terminally and/or subterminally hydroxylated aliphatic carboxylic acids (A) using the microorganisms of (4), or isolated (I). (I), and recombinant calls that express them, are derivatives (esters and anides). (I) have altered substrate specificity, especially for hydroxylation of 8-12C fatty acids at the omega-1, -2 and/or -3 positions, and may also have increased reactivity and/or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              61
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Process for oxidizing acyclic or cyclic terpenes, cycloalkenes, or derivatives for preventing or treating infection in human or animal body comprises mutant haem-containing enzyme which has substitution of amino acid in the active site.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The specification describes a process for oxidizing an acyclic or cyclic terpene, a cycloalkene, or a derivative. The process comprises oxidizing the compound with a mutant haem-containing enzyme which comprises a substitution of an amino acid in the active site by an amino acid with a less polar side-chain. The process is useful for oxidizing an acyclic or cyclic terpene, a cycloalkene, or their derivatives. The process is also useful for product useful for preventing or treating infection in a human or animal body. The present sequence represents the amino acid sequence for use in the process of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                1 TIKEMPOPKTFGELKNLPLLNTDKPVOALMKIADELGEIFKFEAPGRVTRYLSSORLIKE

 Cytochrome P450 monooxygenase; oxidization; indole; indigo; indorubicin
                                                                                                                                                                                                                                                                         The present sequence represents a cytochrome P450 monooxygenase. The specification describes a modified cytochrome P450 monooxygenase which can oxidize at least one of the following types of substrates: optionally substituted mono- or poly-cyclic aromatic heterocyclics containing nitrogen, sulphur or oxygen; optionally substituted mono- or poly-cyclic aromatics; linear or branched alkanes or alkenes; or optionally substituted cycloalkanes or cycloalkenes. The modified cytochrome P450 monooxygenase are specifically used to oxidize indole to indigo and indorubicin. However, they may be used to oxidize many other substrates.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       KDPETGEPLDDENIRYQIITFLIAGHETTSGLLSFALYFLVKNPHVLQKAAEEAARVLVD

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          99
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             9
                                                                                                                                                                        The present sequence represents a modified cytochrome P450 monooxygenase. The specification describes a modified cytochrome P450 monooxygenase which can oxidize at least one of the following types of substrates: optionally substituted mono- or poly-cyclic aromatic heterocyclics containing nitrogen, sulphur or oxygen; optionally substituted mono- or poly-cyclic aromatics; linear or branched alkanes or alkenes; or optionally substituted cycloalkanes or cycloalkenes. The modified cytochrome P450 monooxygenase are specifically used to oxidize indole to indigo and indorubicin. However, they may be used to oxidize indole other substrates.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  9
                                                                                                                                                                                                                                                                                                                                            this sequence does not appear in the specification; it was created information provided.

```
compounds. Also mutants of the monooxygenase enzyme with substitutions it the active site have enhanced oxidation activity. The process and the transgenic plant or animal which expresses the monooxygenase enzyme are used for detoxifying the environment polluted with the halo aromatic compounds. The present sequence is a Bacillus megaterium monooxygenase enzyme, P450BM-3, which is homologous to the monooxygenase

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to a process for enzymatically oxidising the halogenated aromatic compounds such as 1,2-dichlorobenzene, 1,2,4-trichlorobenzene, 3,3'-dichlorobiphenyl or 2,2',4,5,5'-fortachlorobiphenyl. The process comprises treating the polluted environment with a monooxygenase enzyme. A monooxygenase enzyme, P$50cam, and its physiological electron transfer partners, putidaredoxin and putidaredoxin reductase, are used to oxidise the halogenated aromatic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence represents a modified cytochrome P450 monooxygenase. The specification describes a modified cytochrome P450 monooxygenase which can oxidize at least one of the following types of substrates: optionally substituted mono- or poly-cyclic aromatic heterocyclics containing nitrogen, sulphur or oxygen; optionally substituted mono- or poly-cyclic aromatics; linear or branched alkanes or alkenes; or optionally substituted cycloalkanes or cycloalkenes or the modified cytochrome P450 monooxygenase are specifically used to oxidize indole to indigo and indorubicin. However, they may be used to oxidize many
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       note: this sequence does not appear in the specification; it was created using information provided.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The specification describes a modified cytochrome P450 monoxygenase which can oxidize at least one of the following types of substrates: optionally substituted mono- or poly-cyclic aromatic heterocyclics containing nitrogen, sulphur or oxygen; optionally substituted mono- optionally substituted mono- optionally substituted cycloalkanes or alkenes; or optionally substituted cycloalkanes or cycloalkenes. The modified cyclothrome P450 monooxygenase are specifically used to oxidize indole to indigo and indorubicin. However, they may be used to oxidise many other substrates.

                                                                                                                                                                                                                                                                                               The protein is a fusion of bovine adrenal cytochrome P450 17-alpha and Bacillus megaterium-derived cytochrome P450 BM-3. The fusion protein has the monoatomic oxygenation activity of the former and the reductivity supplying activity of the latter. Plasmid p(alphaBM1), containing the recombinant sequence encoding the fusion protein, is used to transform Saccharomyces creevisiae. The transformat is designated AH22(p(alphaBM-1)) and can be used for the synthesis of
